

**Background:** We had just diagonalized a rotation matrix  $A$ . It was not Hermitian, but it was *normal* (to be explained on Dec 6) so we were still able to find two eigenvectors which formed an orthonormal basis for  $C^2$ . So,  $A$  was diagonalizable by a unitary matrix  $U$ . We had gotten to:

$$A = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix} \quad \sqrt{2}U = \begin{pmatrix} i & i \\ -1 & 1 \end{pmatrix} \quad D = \begin{pmatrix} -i & 0 \\ 0 & i \end{pmatrix} \quad \text{and} \quad A = UDU^H$$

**Example:** For practice with the idea of orthonormal basis, let's compute the coordinates of  $\mathbf{x} = [1 + i, 2 + i]^T$  w.r.t. this basis (the columns of  $U$ ). According to Thm 5.5.2, the first coordinate is

$$c_1 = \langle \mathbf{x}, \mathbf{u}_1 \rangle = [-i, -1] \begin{pmatrix} 1 + i \\ 2 + i \end{pmatrix} / \sqrt{2} = (-1 - 2i) / \sqrt{2}$$

Likewise,  $c_2 = \langle \mathbf{x}, \mathbf{u}_2 \rangle = 3 / \sqrt{2}$ . We should check that  $\mathbf{x} = c_1 \mathbf{u}_1 + c_2 \mathbf{u}_2$  (see Thm 5.5.2):

$$c_1 \mathbf{u}_1 + c_2 \mathbf{u}_2 = [(-1 - 2i) \begin{pmatrix} i \\ -1 \end{pmatrix} + 3 \begin{pmatrix} i \\ 1 \end{pmatrix}] / \sqrt{2} = \begin{pmatrix} 1 + i \\ 2 + i \end{pmatrix} = \mathbf{x}$$

Good!
